

Ask not what features it has.

Ask what it connects.

Every yacht PMS has a fault module, a work-order module, a parts module, a supplier module.

All of them. Side by side. With a shared login.

That is not integration.

It is the difference between integration and cohabitation.

The fault you logged this morning sits in one module.

The work order is in another. The part is in a third. The supplier is in a fourth. The audit trail is in a fifth. Nobody links them. Not because nobody wants to. Because nobody built it that way.

The intelligence of a maintenance system is not the modules it has.

It is the connections it makes.

Five rings make the chain.

• Cross-Domain Chain	LINKED
Fault Report	FR-0847 →
Work Order	WO-3291 →
Parts List	PL-1104 →
Purchase Order	PO-0582 →
Receiving	CONFIRMED

Break a link, lose the truth.

A fault without a work order is an open loop. A work order without parts is a guess. A part without a supplier is an orphan. A supplier without an audit trail is a liability.

The Cross-Domain Chain.

Not a feature. The way the vessel knows itself.

Control over your complexity.
